Delegation is an object oriented technique (also called a design pattern). Let's say you have an object x and want to change the behaviour of just one of its methods. You can create a new class that provides a new implementation of the method you're interested in changing and delegates all other methods to

the corresponding method of x

Python performs operations according to the order of precedence, and decides whether a conversion is needed on a per-operation basis. In our example // has the highest precedence, so it will be processed first. 7 and 3 are both integers and // is the integer division operator - the result of this operation is the integer 2.
